1. What is the national hospital price transparency study?

The study is an employer-led initiative to measure and report publicly the prices paid for hospital care *at the hospital- and service-line level*. The Employers' Forum of Indiana is organizing this study and RAND Corp. is conducting the study analyses. This study is the first national report of its kind in that it is an employer-led initiative that uses claims data to compare hospital prices publicly.

The core goals of the study are:

- to enable employers to be better-informed shoppers for health plans and provider networks; and
- to hold hospitals and health plans accountable for the prices they have negotiated.

The first round of the study was completed in mid-2017, and the results are available in three formats:

- a final report, including summary findings, methodology and detailed findings, has been published online on RAND's website,[1]
- a summary slide deck is available from the Employers' Forum of Indiana (EFI),[2] and
- an interactive online map that allows users to pinpoint hospital locations and view their prices.[3]

2. Why is it important for employers, and coalitions of employers, to participate?

Our health care system consumes vast economic resources, without producing commensurate health benefits. Employers, in their role as purchasers of health benefits, have been too passive and have not aligned around a strategy that is capable of materially increasing value from the health care system. Becoming an active, informed purchaser starts with "turning on the lights" and recognizing, as Zack Cooper and colleagues put it, "the price ain't right."[4]

3. How will round two be different from round one?

Round 1 of the study (https://www.rand.org/pubs/research_reports/RR2106.html/) was limited to hospitals in Indiana, and included claims data from mid-2013 through mid-2016 for 225,000 covered lives.

For round 2, we are expanding and improving the study in several ways:

- we are broadening participation among employers in Indiana, increasing the number of covered lives in the state;
- we are inviting employers, and coalitions of employers, across the country to participate, so that a broader set of employers can benchmark their hospital prices locally and with hospitals in other regions;
- we are updating the analysis to include claims data through 2017.

- in addition to conducting an analysis comparing hospital prices to what Medicare would have paid, a subsequent analysis as delineated below will be conducted;
    - we will analyze the casemix-adjusted price for hospital inpatient stays. This will equate to the sum of allowed amounts for inpatient stays divided by sum of MS-DRG weights for inpatient stays.
    - additionally, casemix-adjusted price for hospital outpatient services will equate to the sum of allowed amounts for outpatient services divided by sum of APC weights for outpatient services.
    - the notion is to use Medicare's casemix adjustment algorithms and weights, but not apply Medicare's adjustments for wages, IME and DSH.
    - MedPAC's explanation for MS-DRG weights is as follows:
        - "To account for the patient's needs [in determining the payment amount for an inpatient stay], Medicare assigns discharges to Medicare severity diagnosis related groups (MS–DRGs), which group patients with similar clinical problems that are expected to require similar amounts of hospital resources. Each MS–DRG has a relative weight that reflects the expected relative costliness of inpatient treatment for patients in that group" (MedPAC 2016).
    - MedPAC's explanation for APC weights is as follows:
        - "CMS determines the payment rate for each service by multiplying the relative weight for the service's APC by a conversion factor (Figure 1). The relative weight for an APC measures the resource requirements of the service and is based on the geometric mean cost of services in that APC" (MedPAC 2016).
    - If you are interested in exploring the payment basics further the MedPAC "payment basics" is a terrific resource, the link to the full set is here: http://medpac.gov/-documents-/payment-basics

4. How is the study funded?

Through a combination of foundation grants and contributions from participating employers. The Robert Wood Johnson Foundation (RWJF) fully funded the first round of the study and has expressed an interest in supporting the second round. But, RWJF has also indicated that the second round of the study must be on a path to sustainability, and must draw support from participating employers.

5. How much does it cost for employers to participate?

Each self-funded employer who participates in the study will be asked to contribute $0.20 per covered life, up to a maximum of $15,000 per employer. For example, an employer with 1000 covered lives would contribute $200, and a mega-employer with 75,000 lives or more would contribute the maximum of $15,000. Participating employers' claims data will be included in the public report, and each employer will also receive a customized report showing the prices they paid to each hospital relative to average prices paid.

Fully insured health plans and state-based all payer claims databases (APCDs) will be invited to participate in the study solely as data contributors. For self-funded employers who do not have funds available to contribute to the study, they still will be welcome to participate in the study. These "data-only" participants will provide claims data to be included in the study, but will not receive employer-specific price reports.

6. Why are only self-funded employers asked to contribute?

Self-funded employers are asked to contribute because they have the most to gain. They will receive private individual employer-level reports in addition to the published aggregate reports. Their data comes in messy from the health plans, thus it takes considerable effort to scrub their data clean for analyses. Also, often multiple data files are sent per plan which require data streamlining.

All-payer claims databases (APCDs) can contribute their claims data without charge, because the organizations that maintain APCDs are either not-for-profit entities or governmental agencies. Including claims data from APCDs strengthens the study and provides public benefit to the APCDs and other participants, but those APCDs do not generally have revenue streams or funding available to support analytics by external research organizations. In addition, their data typically comes in clean.

For the fully insured health plans, there is no charge for this group because we decline to accept funding directly from health plans. As opposed to self-funded employers, employers purchasing these products do not own their own claims data and generally have relatively few enrollees, which means that securing study funding from them would be a considerable challenge. At the same time, including claims data from fully insured health plans strengthens the study and provides a public benefit.

7. What information will the employer-specific reports provide?

The employer-specific reports will include:

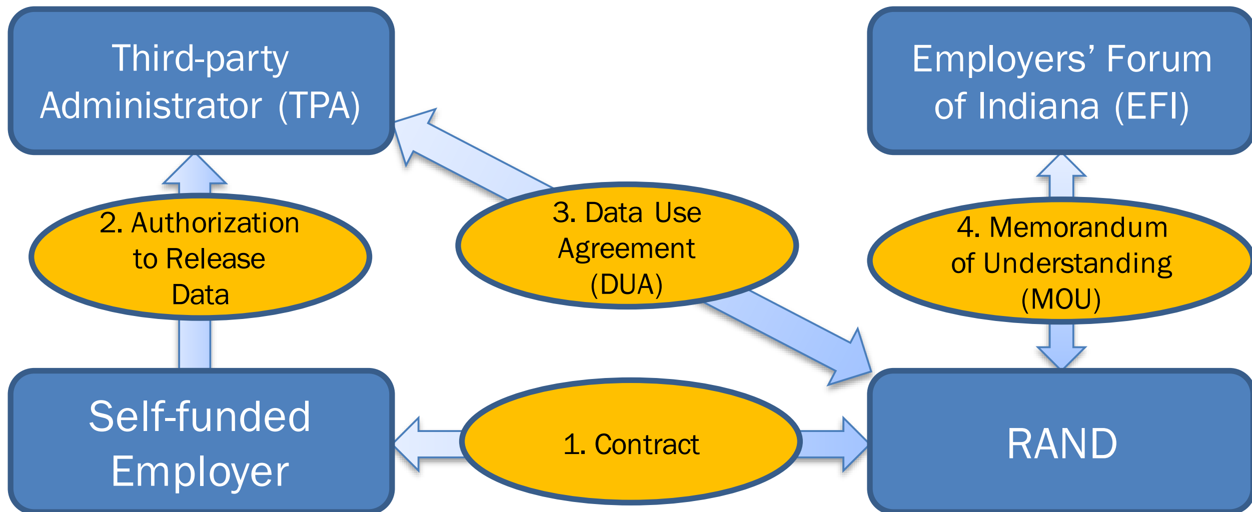
- the actual individual employer total allowed amounts paid to specified hospitals for inpatient and outpatient care, compared to the amount that Medicare would have paid for the same services from the same hospitals; and
- individual employer trends in payment rates in hospital care relative to state, regional, and national aggregated paid trends of average commercial rates, and relative to trends in Medicare payment rates.

Please contact Chapin White (cwhite@rand.org), the lead study researcher, if you would like to receive an example of the tables and figures in an employer-specific price report.

8. What agreements need to be in place for a self-funded employer to participate?

A self-funded employer who participates in the study will enter into a contract with RAND (1. in the figure below) that describes the services RAND will perform and the contribution the employer will provide. The employer will send an authorization (2.) to their third-party

administrator (TPA) instructing them to supply RAND with a copy of their claims data from July 2013-Dec 2017. (3.) RAND and the TPA will enter into a data use agreement (DUA) that specifies the data being transferred and the privacy safeguards that will be in place. RAND and EFI will have a memorandum of understanding (MOU) (4.) that describes the purposes of the study and the roles of the two organizations—that MOU will be referenced by the other 3 agreements.



To view the four agreements, please contact Chapin White (cwhite@rand.org).

9. How will RAND ensure data security and privacy of protected health information (PHI)?

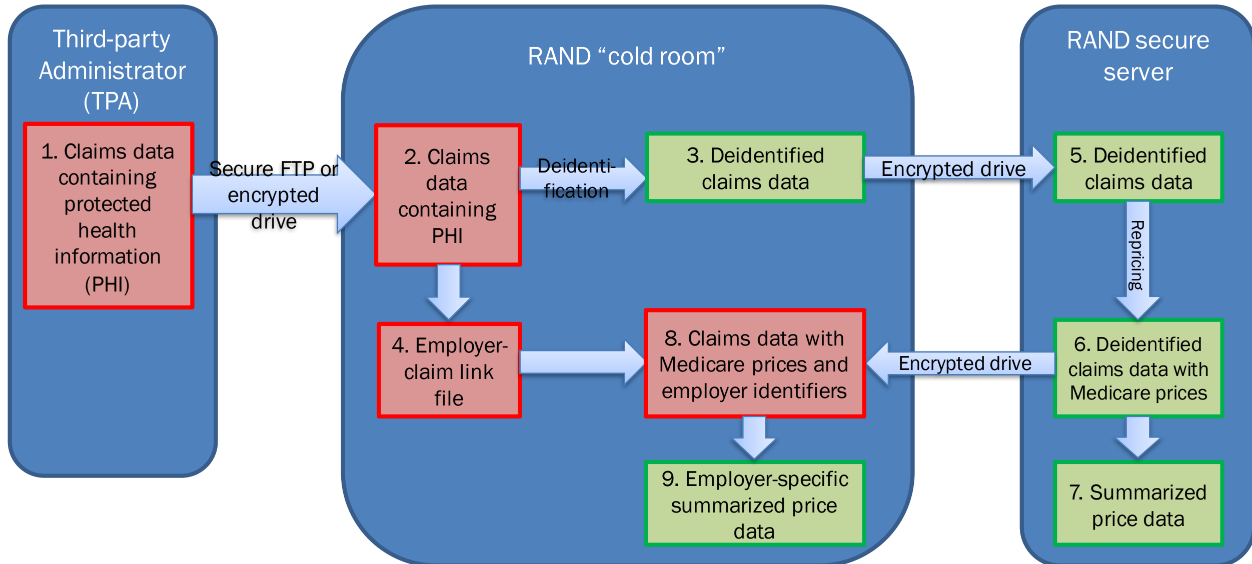
As defined under the Health Insurance Portability and Accountability Act (HIPAA) Privacy Rule, protected health information (PHI) refers to information that identifies an individual and that relates to the individual's medical conditions or health care services.[5] Health insurers, health care providers, and employers that self-fund their health plans are all considered "covered entities," and are, therefore, subject to the HIPAA Privacy Rule, meaning that they must take safeguards to maintain the privacy of PHI.

RAND will enter into DUAs with the TPAs and any other suppliers of claims data, and those DUAs will obligate RAND to adhere to HIPAA privacy standards. The DUAs will specify a data safeguarding plan for protecting privacy of PHI, including physical access controls, network security, and a process for securely deleting PHI once it is no longer needed for the study.

In general, RAND will avoid receiving any data elements that are unnecessary for the study or that could be used to directly identify patients, and RAND will erase data containing PHI as soon as those data have been processed and are no longer necessary. RAND will also limit publication of results based on the number of data points available. For example, hospital-specific prices will only be reported if a minimum number of claims are available. (For the first round, hospital-specific prices were reported only if a minimum of 11 claims were available. That minimum will

be reduced to 5 for the current study in order to include more hospitals, while still maintaining statistical reliability and ensuring patient privacy.)

To illustrate the data safeguarding procedure, the key steps in the data processing are summarized in the figure below.



TPAs and other data suppliers will create extracts of their claims data (1. in the figure) that will contain the minimum fields necessary for the study. Those raw claims data *will not* include direct identifiers (e.g. patient names or medical record numbers) but they will identify the employer and will include detailed information (including dates of service) on health care services. Employer identifiers, when combined with the health and medical records of their employees, are considered PHI because they could, in small firms, be linked to individual employees. Because service dates and employer identifiers are included in the raw claims data, those data must be considered PHI even though direct identifiers are not included.

The TPAs and other data suppliers will transmit the PHI either by secure file transfer protocol (SFTP) or by encrypted drive. Once RAND receives the raw claims data (2. in the figure), it will be loaded onto an "airgapped" workstation (i.e., a computer that it is permanently disconnected from the RAND network and from the internet) in a "cold room" (a locked, high-security workspace that requires a passkey for entry), and the SFTP files and encrypted drive will be securely erased.

RAND analysts will then create two derivative files in the cold room. The first derivative file will be a deidentified claims dataset (3. in the figure) that excludes service dates (except for year) and excludes employer identifiers and thereby satisfies the HIPAA safe harbor standard for deidentification. The second file will be an employer-claim link file (4. in the figure) that only includes two fields: a unique identifier for each claim (this unique identifier will also be included in 3.) and a unique identifier for each employer.

Once RAND has created a deidentified claims dataset in the cold room, it will be transferred using an encrypted drive to a limited-access folder on RAND's secure server (5. in the figure).

RAND analysts will then go through the process of repricing the claims using Medicare's payment formulas, resulting in a deidentified dataset (6. in the figure) containing actual allowed amounts from the raw claims data in addition to simulated Medicare payment amounts. RAND will then produce summarized price data for the public report (7. in the figure).

To produce employer-specific reports, RAND will transfer the deidentified claims data with Medicare prices (6.) back to the cold room using an encrypted drive. Those claims data will then be merged in the cold room with the employer-claim link file to produce a dataset (8. in the figure) containing claims data with actual allowed amounts, simulated Medicare payment amounts, and employer identifiers. That claims dataset will then be processed in the cold room to create employer-specific summarized price data (9. in the figure)—that summary data will include employer identifiers but will not include any individual-level health records and will not, therefore, include PHI.

10. Which employers and coalitions have been invited to participate?

We have reached out to a wide range of employer coalitions and individual employers, including:

- Colorado Business Group on Health
- Economic Alliance for Michigan
- Employers Health
- Florida Health Care Coalition
- Kentuckiana Health Collaborative
- Midwest Business Group on Health
- Minnesota Health Action Group
- Montana Association of Health Care Purchasers
- Northeast Business Group on Health
- Pacific Business Group on Health
- Rhode Island Business Group on Health
- South Carolina Business Coalition on Health
- St. Louis Area Business Health Coalition
- Washington Health Alliance
- Wyoming Business Coalition on Health

11. What is RAND Corp.? What is the Employers' Forum of Indiana?

From RAND's website (https://www.rand.org/about.html), "The RAND Corporation is a research organization that develops solutions to public policy challenges to help make communities throughout the world safer and more secure, healthier and more prosperous." RAND is a nonprofit 501(c)(3) headquartered in Santa Monica, California with offices in Washington, D.C., Pittsburgh, and Boston.

From EFI's website (https://employersforumindiana.org/), "The Forum is an employer-led health care coalition of employers, physicians, hospitals, health plans, public health officials

and other interested parties. Our goal is to improve the value payers and patients receive for their health care expenditures."

12. Who can I contact for more information?

Please contact:

- Chapin White (cwhite@rand.org, 703-413-1100 x5684);
- Chris Whaley (cwhaley@rand.org, 310-393-0411, x7969); or
- Gloria Sachdev (gloria@employersforumindiana.org, 317-847-1969).

13. Does this study fall in the antitrust "safety zone"?

The Federal Trade Commission (FTC) and the U.S. Department of Justice (DOJ) share responsibility for monitoring mergers and anti-competitive behavior, and protecting consumer interests through enforcement of antitrust law. The FTC and DOJ in 1996 released guidance describing their general approach to antitrust enforcement in the health care industries,[6] and the FTC and DOJ have issued more-recent guidance relating specifically to Accountable Care Organizations[7] and to the public disclosure of contracts between health plans and providers.[8]

Hospitals and health systems would put themselves in legal jeopardy with the FTC and DOJ if they engaged in private exchanges of information regarding prices and costs for anticompetitive purposes ("price fixing"). The FTC and DOJ recognize, however, the potential benefits of public exchanges of health care price and cost information, and they have defined a "safety zone" for such exchanges. Those exchanges will not be challenged if "(1) the survey is managed by a third-party, … (2) the information provided by survey recipients is based on data more than 3 months old; and (3) there are at least five providers reported data upon which each disseminated statistic is based, no individual provider's data represents more than 25 percent on a weighted basis of that statistics, and any information disseminated is sufficiently aggregated such that it would not allow recipients to identify the prices charged or compensation paid by any particular provider."[9]

This study satisfies conditions (1) and (2) for the safety zone, but not condition (3)—the reporting of hospital-specific prices falls outside the safety zone. But, as the FTC and DOJ make clear, "public, non-provider initiated surveys may not raise competitive concerns," as long as they are "for procompetitive purposes." The current study, given that it is initiated and supported by employers in their role as purchasers of health care, is clearly procompetitive in its intent, execution, and impact.

The Center for Improving Value in Health Care (CIVHC), the not-for-profit organization that administers Colorado's all payer claims database, analyzes and publicly reports provider-specific price and cost data similar to the public price reports that will result from this study. CIVHC has shared a legal opinion supporting those exchanges, with the key takeaway being that public reports, even if they fall outside the safety zone, are generally permissible "unless competitor recipients of the reports used the information to enter into price-fixing agreements."[10]

14. What is the study timeline?

- June-August 2018: Study enrollment
- September 2018: Claims data files sent to Rand
- September-December 2018: Study analysis by Rand
- January 2019: Publication of study on Rand website

15. What is the role of the state/business coalition and its employers?

The role of the state/business coalition is to provide organizational support for study participants in their respective state(s).

The role of the coalition's employers is to request your TPA/carrier/APCD to submit their claims data to Rand.

Members of the state/regional coalitions should strategically consider how they wish to use the price transparency study to drive healthcare value in their marketplace. This may require partnering with local health plans and health systems/hospitals to develop/create value for employers.
